

Farm Management System

Our understanding of your project — to confirm together

July 2026

1. Overview

This document summarizes what we understood of the software you need and how it would work. It is not a final scope: every point below is our understanding of your farms' operations, written for you to confirm, correct, or remove before we agree on the work.

2. What we understood

You manage several farms. Each farm raises animals and grows crops. Both generate day-to-day expenses: veterinary care and vaccines, feed and vitamins, seeds and fertilizer, workers' wages, and general farm costs. Both also produce goods — milk, eggs, wheat, and more.

These goods can be processed into products kept in stock. Stock can be sold to customers, or used again as an ingredient to produce new products (for example, milk becoming cheese). You can also sell the animals or crops themselves, and sometimes you buy ready goods to resell alongside your own production.

What you want from the system is simple to state: to know, at any moment and for each farm, exactly what was spent, what was produced, what is in stock, what was sold, and how much profit each activity makes.

3. How we imagine the system working

- Each farm records its animals and crops, together with all their costs.
- Production is recorded as it happens: milk, eggs, harvests, and so on.
- Products are converted into stock items. The system records the quantities, the production costs, and any losses during conversion.
- Stock is sold to customers with simple invoices, or consumed again to make new products.
- Purchases are recorded too: supplies (feed, seeds, medicine) and goods bought for resale.
- Animals and crops can also be sold directly as assets.
- Every operation automatically feeds the reports: profit per farm, per animal group, and per crop.

4. Who would use it

Farm manager — mobile app

As we understood it, each farm has a manager who enters the daily data from his phone: expenses, production, sales, and stock movements. Whether this should be one account per farm, or several worker accounts per farm, is one of the points to confirm below.

Owner / administrator — desktop and mobile app

You see all farms in one place: dashboards, comparisons, and detailed reports. The admin account is read-only by default; to correct data, you enter a farm as its manager, and every change is tracked so there is always a clear record of who changed what.

5. Features as we understood them — please confirm each point

The following is what we believe the app should contain, written as questions. Your answers will define the final scope.

Animals

- Should each animal be registered individually (with a tag number), as groups/flocks, or both?
- Do you want a health record — vaccines and veterinary visits — with a reminder for the next due date?
- Should feeding and vitamin costs be linked to each animal or group, or recorded in general?
- Which lifecycle events matter to you: birth, purchase, sale, loss?

Crops

- Is a simple registry of the crops grown, with their type and quantities, enough?
- Should planting and harvest dates be recorded, with harvest quantities counted as production?
- Which crop costs should be tracked: seeds, fertilizer, treatments, irrigation, labor?

Expenses and workers

- Should every expense be categorized and linked to its source (an animal, a crop, a worker, or the farm in general)?
- Do you want to attach a photo of the receipt to an expense?
- Is it enough that worker wages are entered as simple expenses — with no payroll management?

Purchases and suppliers

- Do you buy supplies and goods for resale, and do you need a supplier registry with balances?

Production and stock

- Do you need production tracking at all — and how exactly does production work on your farms today?
- Would recipes help: define once what goes into each product, then record production runs quickly?
- Should losses and production costs be recorded for every run, so the real cost of each product is known?
- Do you want stock levels with an alert when an item runs low, and a full movement history?

Sales and customers

- Do you need a full sales module, or only tracking invoices — with no point of sale?
- Do you sell on credit, and do you need customer balances?
- Should selling an animal or a crop directly be supported, with the profit calculated against its accumulated costs?

Reports

- Which reports matter most to you: profit per farm, per animal group, per crop? Expense breakdown? Production efficiency?
- Do you need to export reports to PDF or Excel?

6. Technology, in plain words

- One system, three doors: a mobile app for the farms, and a desktop + mobile app for you.
- Your data lives on a secure online server, with each farm's data kept separate and daily automatic backups.
- The system works online, so what you see is always the current, real-time state of every farm.
- Interface available in Arabic and English (French can be added).
- Built with proven, widely used technologies that are easy to maintain for years.

7. Points to confirm together

- One account per farm (the manager only), or several workers per farm, each with their own account?
- Who will enter the data, and how comfortable are they with technology? Can they use an app and enter numbers correctly?
- How are the animals fed and tracked: per animal, per group (cow group 1, cow group 2...), or all together?
- Do you need production tracking, and how exactly does it work on your farms today?
- Do you need a full sales application, or only invoice tracking (no point of sale)?
- Is internet coverage at the farms good enough for an online app?
- How many farms and users at launch?
- Which language should the interface start with?
- Do invoices need to follow any legal/tax format?
- Do you have a timeline or a target launch date in mind?
- Which part of the system matters most to you to have first?

8. Next steps

Once these points are confirmed, we will send the final scope, the delivery plan, and the quotation. Development starts right after agreement, handled by our two-developer team, with regular working demos so the direction can be corrected early.
